

DIGITAL TEMPLATING IN THR

Do scaling markers improve accuracy?

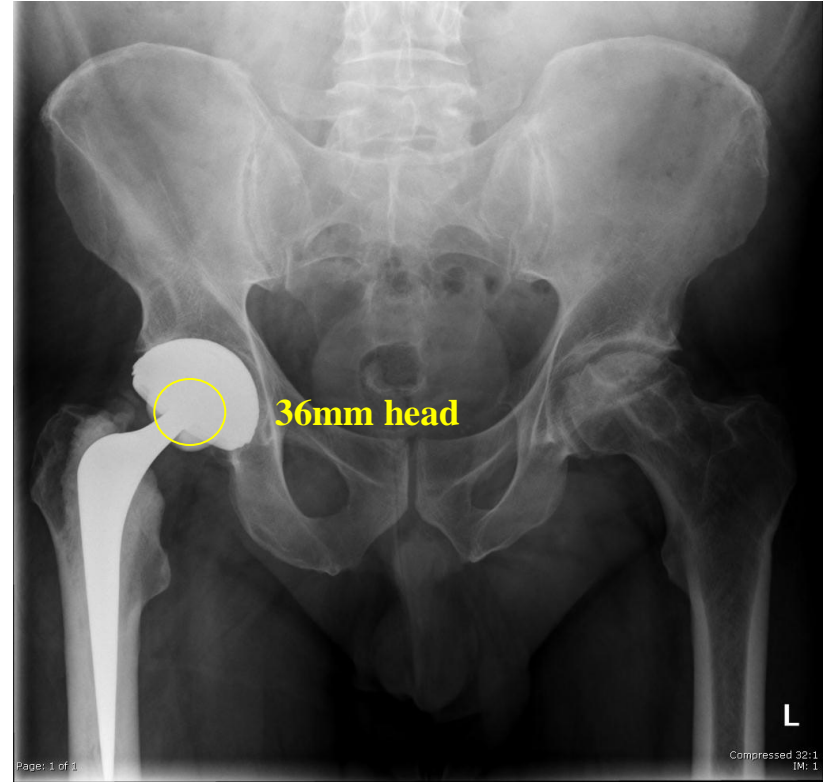

Dr. Duy Thai

Barwon Orthopaedic Research Unit

Geelong Hospital, Victoria

Magnification is dependant on how far the object being imaged is from the Xray plate

- No scaling marker available?
- “Ruler method”
 - At the level of the plate, not the patient

- OrthoView™ is used at Barwon Health
 - Allows digital image of pelvis to be imported from PACS
 - Scaling of image performed
 - Appropriately scaled template used
 - Library of prostheses from different companies

Disclosure: No outside funding or grants were received from OrthoView, Meridian Technique LTD, UK for this research or preparation of this work

Aims

- Does the use of a scaling marker improve accuracy of digital templating in THR

Methodology

- PACS online at Barwon Health from July 2007
- Inclusion criteria:
 - All primary THR done since introduction of PACS
 - Must have digital pre op Xrays
 - Prosthesis must be in the OrthoView template library
- 114 Cases
 - 62 Without scaling marker (54%)
 - 52 With scaling marker (46%)

Methodology

- Size difference between actual prosthesis implanted and templated prosthesis recorded

Conclusion

- Does the use of a scaling marker improve accuracy of digital templating in THR?
 - Yes, more with Femoral stem
 - 93% accurate (Scaler) vs 82% accurate (Ruler)
